Features

Cross References

In order to create links to other sections
As a writer
I want to be able to use a cross reference macro

Scenario: Create a cross reference from an AsciiDoc cell to a section

```
Given
  the AsciiDoc source de (000ms)
  |===
 a|See <<_install>>
  |===
 == Install
 Instructions go here.
When
  it is converted to html do (002ms)
Then
  the result should match the HTML structure d (005ms)
 table.tableblock.frame-all.grid-all.spread
    colgroup
      col style='width: 100%;'
    tbody
      tr
        td.tableblock.halign-left.valign-top
            .paragraph: p
              a href='#_install' Install
  .sect1
   h2#_install Install
    .sectionbody
      .paragraph: p Instructions go here.
```

Scenario: Create a cross reference using the target section title

```
Given
  the AsciiDoc source 🕯 (000ms)
 == Section One
 content
 == Section Two
 refer to <<Section One>>
When
  it is converted to html do (000ms)
Then
  the result should match the HTML structure d (004ms)
  .sect1
   h2#_section_one Section One
    .sectionbody: .paragraph: p content
  .sect1
   h2#_section_two Section Two
   .sectionbody: .paragraph: p
      'refer to
      a href='#_section_one' Section One
```

Scenario: Create a cross reference using the target reftext

```
Given
  the AsciiDoc source 🕯 (000ms)
  [reftext="the first section"]
 == Section One
 content
 == Section Two
 refer to <<the first section>>
When
  it is converted to html do (000ms)
Then
  the result should match the HTML structure do (005ms)
  .sect1
   h2#_section_one Section One
    .sectionbody: .paragraph: p content
  .sect1
   h2#_section_two Section Two
    .sectionbody: .paragraph: p
      'refer to
      a href='#_section_one' the first section
```

Scenario: Create a cross reference using the formatted target title

```
Given
  the AsciiDoc source de (000ms)
  == Section *One*
 content
 == Section Two
 refer to <<Section *One*>>
When
  it is converted to html do (001ms)
Then
  the result should match the HTML structure ▲ (005ms)
  .sect1
   h2#_section_strong_one_strong
      'Section
      strong One
    .sectionbody: .paragraph: p content
  .sect1
   h2#_section_two Section Two
    .sectionbody: .paragraph: p
      'refer to
      a href='#_section_strong_one_strong'
        'Section
        strong One
```

Open Blocks

```
In order to group content in a generic container
As a writer
I want to be able to wrap content in an open block
```

Scenario: Render an open block that contains a paragraph to HTML

Scenario: Render an open block that contains a paragraph to DocBook

```
the AsciiDoc source → (000ms)

---
A paragraph in an open block.
---

When
it is converted to docbook → (003ms)

Then
the result should match the XML source → (000ms)

<simpara>A paragraph in an open block.</simpara>
```

Scenario: Render an open block that contains a paragraph to HTML (alt)

```
the AsciiDoc source → (000ms)

---
A paragraph in an open block.
---

When
it is converted to html → (000ms)

Then
the result should match the HTML structure → (019ms)

.openblock
.content
.paragraph
p A paragraph in an open block.
```

Scenario: Render an open block that contains a paragraph to DocBook (alt)

```
Given
the AsciiDoc source → (000ms)

---
A paragraph in an open block.
---

When
it is converted to docbook → (000ms)

Then
the result should match the XML structure → (003ms)

simpara A paragraph in an open block.
```

Scenario: Render an open block that contains a list to HTML

```
Given
  the AsciiDoc source ๗ (000ms)
  * one
  * two
  * three
When
  it is converted to html do (000ms)
Then
  the result should match the HTML structure d (004ms)
  .openblock
    .content
      .ulist
        ul
          li: p one
          li: p two
          li: p three
```

Open Blocks

```
In order to pass content through unprocessed
As a writer
I want to be able to mark passthrough content using a pass block
```

Scenario: Render a pass block without performing substitutions by default to HTML

Scenario: Render a pass block without performing substitutions by default to DocBook

Scenario: Render a pass block performing explicit substitutions to HTML

```
Given
    the AsciiDoc source  (000ms)

:name: value
[subs="attributes,macros"]
++++
    {name}
image:tiger.png[]
++++

When
    it is converted to html (000ms)

Then
    the result should match the HTML source (000ms)

<span class="image"><img src="tiger.png" alt="tiger"></span>
```

Text Formatting

In order to apply formatting to the text As a writer I want to be able to markup inline text with formatting characters

Scenario: Convert text that contains superscript and subscript characters

```
Given
  the AsciiDoc source (000ms)
  _v_~rocket~ is the value
 ^3^He is the isotope
 log~4~x^n^ is the expression
 M^me^ White is the address
 the 10^th^ point has coordinate (x~10~, y~10~)
When
  it is converted to html do (000ms)
Then
  the result should match the HTML source do (000ms)
  <div class="paragraph">
 <em>v</em><sub>rocket</sub> is the value
 <sup>3</sup>He is the isotope
 log<sub>4</sub>x<sup>n</sup> is the expression
 M<sup>me</sup> White is the address
  the 10<sup>th</sup> point has coordinate (x<sub>10</sub>, y<sub>10</sub>)
  </div>
```

Scenario: Convert text that has ex-inline literal formatting

Scenario: Convert text that has ex-inline monospaced formatting

```
the AsciiDoc source → (000ms)

The document is assumed to be encoded as [x-]+{encoding}+.

When
it is converted to html → (000ms)

Then
the result should match the HTML source → (000ms)

<div class="paragraph">
The document is assumed to be encoded as <code>UTF-8</code>.
</div>
```
